Devlin argues that mathematical thinking evolved as the human brain developed the capacity for language, and spends a majority of the book discussing human evolution and linguistics. While starting off well, "The Math Gene" quickly turns into a long drawn-out discussion of language--beyond what is necessary to prove the point to the casual reader.

As Devlin says in the book, "Modern mathematics books are awash with symbols, but mathematical notation no more is mathematics than musical notation is music." Many people think that mathematics is somehow the study of and manipulation of numbers (a colleague of mine from another department often jokingly asks me whether we mathematicians have discovered any new numbers lately).

"The Math Gene" presents a theory of how mathematical ability and language are related, and how they might have evolved. Devlin starts by separating "number sense" from mathematical ability. Many animals as well as humans can estimate the quantity of something; rats can be taught to press a lever about sixteen times to get a reward.

In mathematical genetics, a genetic algebra is a (possibly non-associative) algebra used to model inheritance in genetics. Some variations of these algebras are called train algebras, special train algebras, gametic algebras, Bernstein algebras, copular algebras, zygotic algebras, and baric algebras (also called weighted algebra). The study of these algebras was started by Etherington ().
